Before new interventions can be used in disease control programmes, it is essential that they are carefully evaluated in “field trials”, which may be complex and expensive undertakings. Descriptions of the detailed procedures and methods used in trials that have been conducted in the past have generally not been published. As a consequence, those planning such trials have few guidelines available and little access to previously accumulated knowledge. In this book the practical issues of trial design and conduct are discussed fully and in sufficient detail for the text to be used as a “toolbox” by field investigators. The toolbox has now been extensively tested through use of the first two editions and this third edition is a comprehensive revision, incorporating the many developments that have taken place with respect to trials since 1996 and involving more than 30 contributors. Most of the chapters have been extensively revised and 7 new chapters have been added.
• No image available 10: Censuses and mapping
• No image available 11: Randomization, blinding, and coding
• No image available 12: Outcome measures and case definition
• No image available 13: Preliminary studies and pilot testing
• No image available 14: Questionnaires
• No image available 15: Social and behavioural research
• No image available 16: Field organization and ensuring data of high quality
• No image available 17: Field laboratory methods
• No image available 18: Budgeting and accounting
• No image available 19: Intervention costing and economic analysis
• No image available 20: Data management
• No image available 21: Methods of analysis
• No image available 22: Phase IV studies
• No image available 23: Reporting and Using Trial Results
